

Trying to fight weeds? Have bare spots? Need to thicken your lawn?

# 9•1•1 OVERSEEDING TO THE RESCUE

Healthy turf is the best way to fight weeds, insects and diseases.

9 1 1

OVERSEEDING

## Benefits of 9•1•1 OVERSEEDING

- 100% Certified Seed tested and graded by accredited experts
- Self-repairing turf: fills in bare spots naturally
- Quick to establish
- Produces a soft, lush, thick lawn
- Good disease resistance
- Drought tolerant

SPEARESEEDS

"Although many homeowners focus on the basics like mowing and fertilizing, the one key care component that is often overlooked is the constant reintroduction of seed (overseeding). The steady introduction of new turfgrass plants may be one of the most important practices in the overall management of a healthy and vigorous home lawn"

– John Bladon, The Chimera Group

## What is Overseeding?

Overseeding is the planting of grass seed directly onto your lawn, without tearing up the turf or the soil. It's an easy way to fill in bare spots, improve the density and colour of your lawn and keep your lawn healthy and free of weeds.

## Reduce insects in your lawn with 9•1•1 Overseeding

9•1•1 Overseeding Mixture is enhanced with endophytes (a natural, beneficial fungus that grows inside a grass plant) which creates a natural compound within the grass that insects prefer not to feed on. Grow green and save green!

## Give your grass a head start for Spring

Late Summer / Early Fall is the best time to overseed or repair thin or bare areas in your lawn. The soil and temperatures are most favourable for optimum seed germination and growth. With adequate moisture, fertilizer and sunlight the new seedlings will thrive without the heat that occurs in the summer months.

9•1•1 Overseeding uses the latest technology and is specifically designed for late summer overseeding to turn your brown upside down!
