

WILDFLOWER MEADOW EFFECT MIXTURE

Designed for areas where a low maintenance, attractive ground cover is desired, Speare Seeds' Wildflower Meadow Effect Mixture is a blend of our Northern Region Wildflower Mixture and Sheep Fescue.

When planted in the spring, this mixture will establish with the look of a normal lawn. The annual flowers will bloom throughout the first season leaving the perennials to become established and continue blooming in subsequent years.

Sheep fescue is combined with the wildflowers to help prevent soil erosion and to provide a meadow like appearance during establishment. Due to its nature, sheep fescue allows the wildflowers room to establish and stays low enough to show off the wildflower blooms.

Minimum maintenance is required to maintain a colourful stand. Clipping the area in mid-November at a height of 6-8 inches will help to reduce the amount of dead material present the following spring.

Suggested Planting Rate: 6 lb. / 1,000 sq. ft.
